## DETERMINING THE LIMITING REAGENT AND THEORETICAL YIELDS FOR ASPIRIN SYNTHESIS REACTION

## Formulas to remember:

One mole of a substance = formula mass in grams .
Formula mass of a substance $=$ total atomic masses of all atoms in the chemical formula. Example:

Salicylic acid: $\mathrm{C}_{7} \mathrm{H}_{6} \mathrm{O}_{3}$

| Element | Atomic mass |  | $x$ | $\#$ of atoms | $=$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Carbon (C) | 12 u |  | $x$ | 7 |  |
| Hydrogen (H) | 1 u | $x$ | 6 | 84 u |  |
| Oxygen (O) | 16 u | $x$ | 3 | $=$ | 6 u |
|  |  |  |  |  |  |
|  |  |  |  |  |  |
|  |  |  |  |  |  |

138 u
Molar mass (gram formula mass) for $\mathrm{C}_{7} \mathrm{H}_{6} \mathrm{O}_{3}=138 \mathrm{~g}=$ mass of 1 mole

Fill in the following information to determine the limiting reagent in this reaction. In the space below the name of each reagent, show your calculations for determining the reagent's molar mass and number of moles used.
Reagent Molar Mass (in g) Mass used in lab $\quad$ Moles $=\frac{\text { mass in g }}{\text { molar mass }}$

Salicylic acid
$3 \mathbf{g}$
$\mathrm{C}_{7} \mathrm{H}_{6} \mathrm{O}_{3}$

Acetic anhydride
$\mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{3}$
$6 \mathrm{~mL}^{*}=\quad \mathrm{g}$
*Convert to g
$\mathrm{m}=\mathrm{vxd}$
Density of acetic anhydride $=1.08 \mathrm{~g} / \mathrm{mL}$

The reagent with the smaller number of moles is the limiting reagent. In other words, in the reaction between 3 g of salicylic acid and 6 mL of acetic anhydride, the limiting reagent, or the reagent that is completely used up, is:

Insert the number of moles of limiting reagent (calculated on the previous page) into the value for Moles, below. Use the following equation to calculate the theoretical yield for each of the products.

Theoretical yield $=($ moles of limiting reagent) $\times$ (molar mass of product)
Reagent Molar Mass (in g) Moles $\quad$ Theoretical yield (in g)

Acetylsalicylic acid $\mathrm{C}_{9} \mathrm{H}_{8} \mathrm{O}_{4}$
(aspirin)

Acetic acid

$$
\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{O}_{2}
$$

Thus, in the reaction between 3 g of salicylic acid and 6 mL of acetic anhydride, the theoretical yield for acetylsalicylic acid is: $\qquad$ g and the theoretical yield for acetic acid is: $\qquad$ g.

# A Swell Acetylsalicylic Acid Synthesis Lab Worksheet 

## DATA/RESULTS

Mass of filter paper alone: $\qquad$
Mass of filter paper plus solid (aspirin): $\qquad$
$\qquad$

Mass of aspirin (actual yield from this reaction): $\qquad$
Observed melting point of aspirin from this experiment: $\qquad$

## CALCULATIONS - COMPARING MELTING POINTS

Use the following formulas and values to determine the percent error between the observed melting point of the aspirin you produced versus the accepted (literature) melting point for pure aspirin.

$$
\% \text { error }=\left(\frac{\text { accepted value }- \text { observed value }}{\text { accepted value }}\right) \times 100
$$

Accepted (literature) melting point for pure aspirin: $\quad 135^{\circ} \mathrm{C}$

Observed melting point of aspirin from this experiment: $\qquad$
Percent error between the observed melting point of the aspirin you produced versus the accepted (literature) melting point for pure aspirin: $\qquad$ \% NOTE: Show your work for determining the percent error in the space below.

If the melting point for the aspirin you synthesized was lower than the accepted melting point for pure aspirin ( $135^{\circ} \mathrm{C}$ ), you can infer that your aspirin has some impurities. What might have caused these impurities? What might some of these impurities be?

## CALCULATIONS - ACTUAL YIELD VS. THEORETICAL YIELD OF ASPIRIN

Use your data and the formulas below to determine the percent yield of aspirin from this experiment.
Theoretical yield of aspirin: $\qquad$ moles $=$ $\qquad$ g

Actual yield of aspirin from this lab: $\qquad$ moles $=$ $\qquad$ g
NOTE: Moles $=\frac{\text { mass in g }}{\text { molar mass }}$

$$
\% \text { yield }=\left(\frac{\text { actual yield }}{\text { theoretical yield }}\right) \times 100
$$

Percent yield of aspirin from this experiment (show your calculations in the space below): $\qquad$ \%

Lab \#14 A Swell Acetylsalicylic Acid Synthesis Additional Post Lab Questions

1. Why is it necessary to use glycerol rather than water for the melting point heat bath?
2. Even if your results were "perfect", list potential causes for the following. Between the two answers combined, include a minimum of three different reasons. Think of procedural causes, rather than "errors in calculation".
a. Product mass greater than the maximum calculated?
b. Product mass less than expected?

## Additional Stoichiometry Practice!!

3. A reaction between methane and sulfur produces carbon disulfide (CS2), a liquid often used in the production of cellophane. The balanced equation is:
$2 \mathrm{CH}_{4}+\mathrm{S}_{8} \longrightarrow 2 \mathrm{CS}_{2}+4 \mathrm{H}_{2} \mathrm{~S}$
a. Calculate the moles $\mathrm{CS}_{2}$ produced when $1.5 \mathrm{~mol} \mathrm{~S}_{8}$ is used.
b. How many moles $\mathrm{H}_{2} \mathrm{~S}$ produced?
4. Titanium is a transition metal used in many alloys because it is extremely strong and lightweight. Titanium tetrachloride $\left(\mathrm{TiCl}_{4}\right)$ is extracted from titanium oxide using chlorine and coke (carbon).

$$
\mathrm{TiO}_{2}(\mathrm{~s})+2 \mathrm{Cl}_{2}(\mathrm{~g}) \quad \longrightarrow \mathrm{TiCl}_{4}(\mathrm{~s})+\mathrm{CO}_{2}(\mathrm{~g})
$$

If you begin with $1.25 \mathrm{~mol} \mathrm{TiO}_{2}$, what mass of $\mathrm{Cl}_{2}$ gas is needed? (Show your work)
5. One in a series of reactions that inflate air bags in automobiles is the decomposition of sodium azide $\left(\mathrm{NaN}_{3}\right)$.
$2 \mathrm{NaN}_{3}(\mathrm{~s}) \longrightarrow 2 \mathrm{Na}(\mathrm{s})+3 \mathrm{~N}_{2}(\mathrm{~g})$
Determine the mass of $\mathrm{N}_{2}$ produced if 100.0 g NaN 3 is decomposed. (Show your work)
